SAT Encodings for the Car Sequencing Problem

Valentin Mayer-Eichberger and Toby Walsh

16/09/2013 Doctoral Program at CP

Car Sequencing

Source Wikipedia

- Cars require different options (air-conditioning, sun-roof, etc.)
- Is there a production sequence for cars on the assembly line satisfying the sliding capacity constraints?
- CSPLib Benchmark Nr. 1
- CP, IP, local search

Car Sequencing: Example

- $C = \{1, 2, 3\}$ with demand $d_1 = 3, d_2 = 2, d_3 = 2$
- $O = \{a, b\}$ with capacity constraints $1/2$ and $1/5$
- Class 1 no restriction
- Class 2 requires option a
- Class 3 requires option a and b

Sequence of cars	3	1	2	1	2	1	3
Option a	1	-	1	-	1	-	1
Option b	1	-	-	-	-	-	1

Car Sequencing: Example

- $C = \{1, 2, 3\}$ with demand $d_1 = 3, d_2 = 2, d_3 = 2$
- $O = \{a, b\}$ with capacity constraints $1/2$ and $1/5$
- Class 1 no restriction
- Class 2 requires option a
- Class 3 requires option a and b

Sequence of cars	3	1	2	1	2	1	3
Option a	1	-	1	-	1	-	1
Option b	1	-	-	-	-	-	1

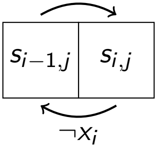
Car Sequencing is NP-Complete

The SAT Approach: The Ultimate Decomposition

- ONE type of constraint: $a \vee b \vee \neg c$.
- ONE propogator: a and $\neg a \vee b$ then propagate b.
- Using SAT solvers as blackboxes.
- PhD Topic: What are good translations and why?
- Central constraint in car sequencing:

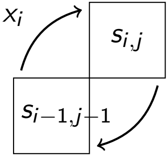
$$(\sum_{i=1}^{n} x_i = d) \wedge \bigwedge_{i=0}^{n-q} (\sum_{l=1}^{q} x_{i+l} \leq u)$$

Sequential Counter



$$\neg s_{i-1,j} \vee s_{i,j}$$

$$x_i \vee \neg s_{i,j} \vee s_{i-1,j}$$



$$\neg x_i \vee \neg s_{i-1,j-1} \vee s_{i,j}$$

$$\neg s_{i,j} \vee s_{i-1,j-1}$$

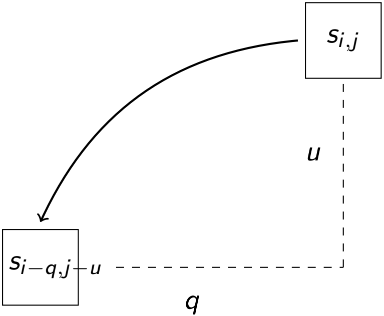
- This idea can translate all cardinality constraints

Demand Constraint + Capacity Constraint

$$(\sum_{i=1}^{n} x_i = d) \wedge \bigwedge_{i=0}^{n-q} (\sum_{l=1}^{q} x_{i+l} \leq u)$$

Demand Constraint + Capacity Constraint

$$(\sum_{i=1}^{n} x_i = d) \wedge \bigwedge_{i=0}^{n-q} (\sum_{l=1}^{q} x_{i+l} \leq u)$$



$$\neg s_{i,j} \vee s_{i-q,j-u}$$

Discussion: Related Work

- Sinz: Sequential Counter CNF [6]
- Een and Soerensson: Translation through BDDs to CNF [3]
- Bacchus: Decomposition through DFAs to CNF [1]
- Brand et al: Decomposition to cumulative sums for CP [2]
- Siala et al: Linear time propagator for CP [5]

Conclusions and Future Work

- SAT is strong on instances of the CSPLib
- Global Constraints motivate for encodings
- Choosing the right encoding of cardinality constraints is crucial
- SAT can be very competitive on CP benchmarks

Future work:

- Fair Comparison to CP, IP, ASP, LS ...
- Prove of GAC and lower bound on size
- Idea useful in rostering, planning, scheduling?
- Exponential encoding in the number of options?
- New instances!

Capacity Constraints: Example

Capacity constraint $4/8$, demand $d = 12$ on a sequence of 22 variables:

13																					U	U	U
12																				U	?	?	L
11																			U	?	?	L	
10																		U	?	?	L		
9													U	U	U	U	U	?	?	L			
8												U	?	?	L	L	L	L	L				
7											U	?	?	L									
6										U	?	?	L										
5					U	U	U	U	U	?	?	L											
4				U	?	?	L	L	L	L	L												
3			U	?	?	L																	
2		U	?	?	L																		
1	U	?	?	L																			
0	L	L	L																				
$s_{i,j}$	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22
x_i								**0**	**0**							**0**	**0**						

Capacity Constraints: Example

Partial Assignment: x_1 and x_{13} to true and x_{12}, x_{14} and x_{21} to false.

13																					U	U	U
12																				U	0	0	L
11																			U	?	1	L	
10																		U	?	1	L		
9													U	U	U	U	U	?	1	L

Link between Cars and Options

$\forall i \in \{1 \ldots n\}$:

$$\bigwedge_{\substack{k \in C \\ l \in O_k}} \neg c_i^k \vee o_i^l \tag{6}$$

$$\bigwedge_{\substack{k \in C \\ l \notin O_k}} \neg c_i^k \vee \neg o_i^l \tag{7}$$

$$\bigwedge_{l \in O} \left(\neg o_i^l \vee \bigvee_{k \in C_l} c_i^k \right) \tag{8}$$

Example for non GAC of E2

Example

Let $n = 5$, $d = 2$ with a capacity constraint of $1/2$, and let x_3 be true, then unit propagation does not force x_2 nor x_4 to false. Setting them to true will lead to a conflict through clauses (12) and (**??**) on positions 2, 3 and 4.

3				U	U	U
2		U	U	.	.	L
1	U	.	.	L	L	
0	L	L	L			
$s_{i,j}$	0	1	2	3	4	5
x_i		.	.	1	.	.

Sequential Counter

$\forall i \in \{1 \ldots n\}\ \forall j \in \{0 \ldots d+1\}$:

$$\neg s_{i-1,j} \vee s_{i,j} \tag{9}$$

$$x_i \vee \neg s_{i,j} \vee s_{i-1,j} \tag{10}$$

$\forall i \in \{1 \ldots n\} \forall j \in \{1 \ldots d+1\}$:

$$\neg s_{i,j} \vee s_{i-1,j-1} \tag{11}$$

$$\neg x_i \vee \neg s_{i-1,j-1} \vee s_{i,j} \tag{12}$$

$$s_{0,0} \wedge \neg s_{0,1} \wedge s_{n,d} \wedge \neg s_{n,d+1} \tag{13}$$

A Trick for Lower Bounds ([4])
